

HWgSMSGW

HW group is featuring a GSM gateway, which eases the work and lowers the administration expenses. HWg-SMS-GW is designated for sending alert SMS messages from HWg devices. No software is required and the gateway works on LAN network in Box-2-Box (Peer-to-Peer) mode.

This means that IP sensors and other HWg devices connected to the same network can send alert messages through HWg-SMS-GW.

A huge advantage is then the use of only one SIM card for sending alert SMS messages from all devices. It is not recommended to use a pre-paid SIM card, on the other side a post-paid card works reliably without any stops and problems.

The gate can be configured via its web interface, however the receiver's phone number is set directly in the devices settings (HWg-PWR 3/12/25, HWg-WLD, Poseidon 2250, Poseidon 4002, Poseidon 3268). This way you can send messages to several numbers through one SMS gateway. The SMS + Ring function will also notify the receiver by ringing the phone number. External antennae allows using this device in data centers. Quad-Band GSM modem gives connectivity anywhere with a GSM coverage.
